

Pilot 3: The FishGlassHouse

Tasks under WP 5.1, 5.2 and 5.3

Modern aquaponics in Mecklenburg-Western-Pomerania, Germany

*University of Rostock, Germany
Aquaculture & Sea-Ranching*

- *Prof. Dr. rer. Nat. Harry W. Palm*
- *Dr. Adrian Bischoff-Lang*
- *M.Sc. Jan Eike Krämer*
- *M.Sc. Jan Klein*
- *M.Sc. Troung Van Thuong*

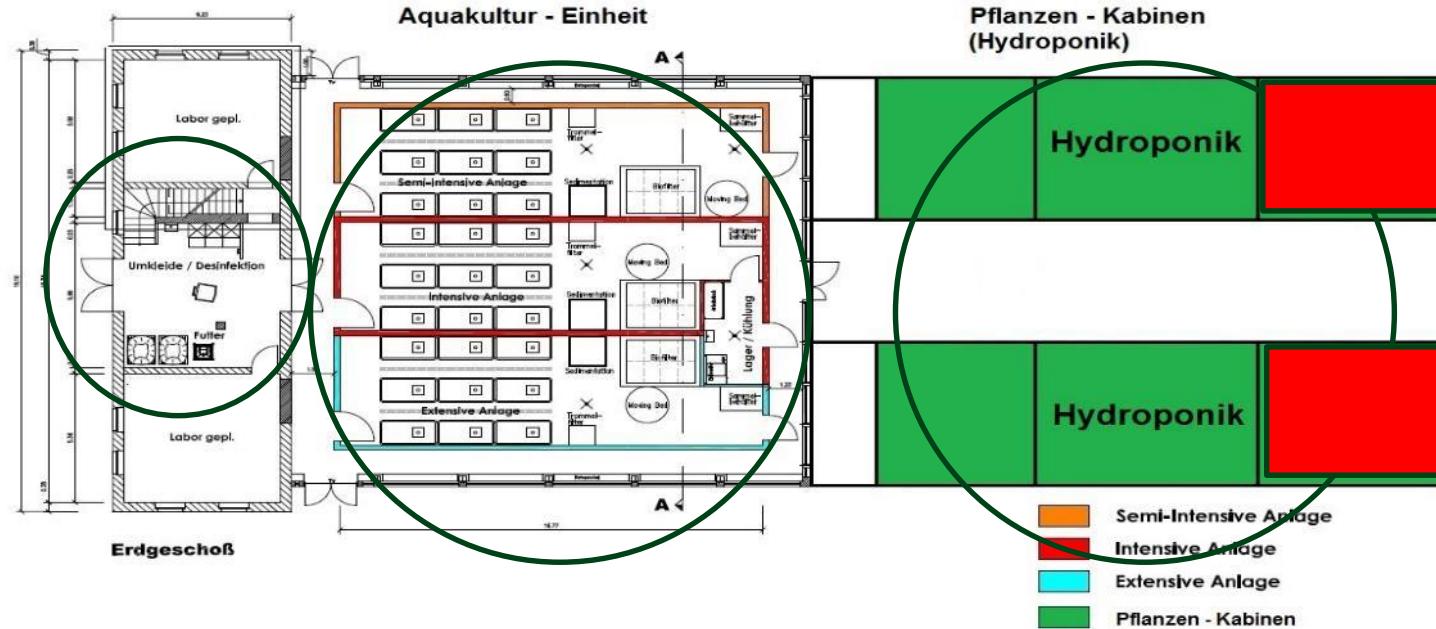

The “FishGlassHouse”

- Three different aquaculture units – different stocking density of African catfish (*Clarias gariepinus*)
 - extensive (35 individuals per m³)
 - semi-intensive (70 individuals per m³)
 - intensive (140 individuals per m³)
 - ➔ **1:1 copy of a commercial production unit**
- Six different cabines for plant cultivation

The FishGlassHouse (Aquaculture & Hydroponics)

- Two main units:
 - Aquaculture unit
 - Hydroponic unit
- Construction as closed recirculation aquaculture systems
- Laboratories

The Aquaculture units

Automatic control

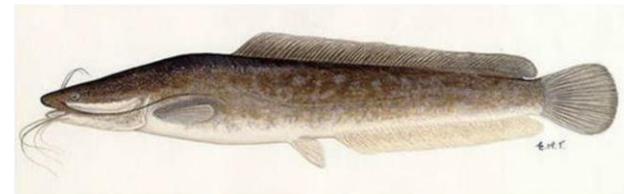

- extensive RAS
- semi-intensive RAS
- intensive RAS

→ 9 fish tanks per unit (triplicate – staggered)

Intensive RAS

African catfish (*Clarias gariepinus*)

<http://www.fao.org/typo3temp/pics/7b7e489048.jpg>

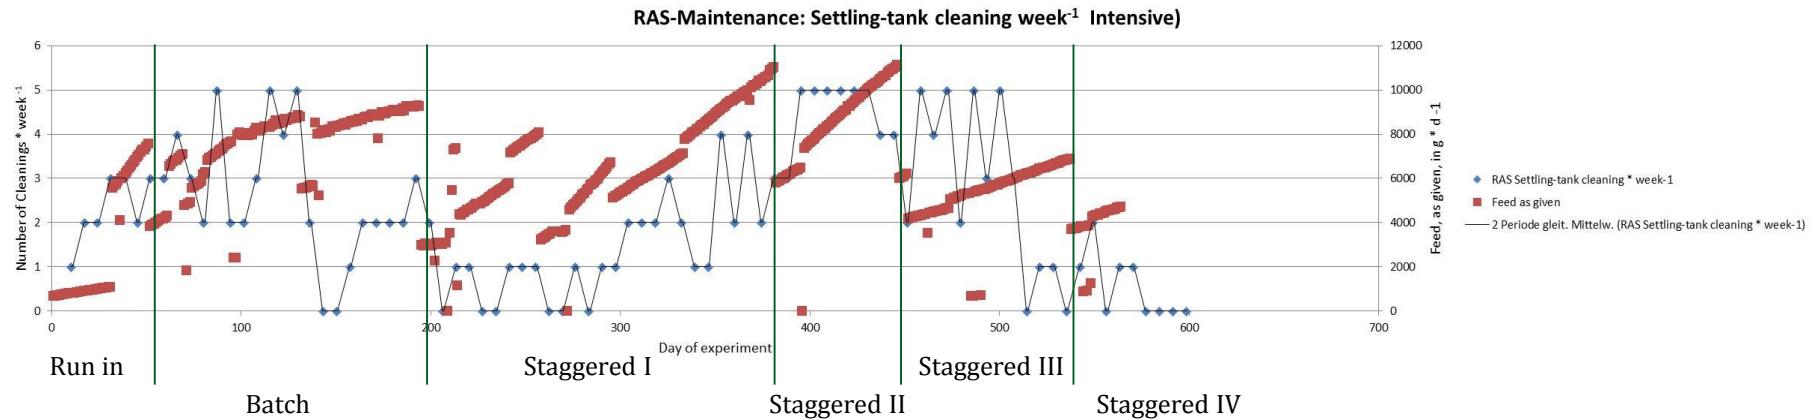

Automatic feeders

RAS = Recirculating Aquaculture System

Activity 5.1 => Input for WP3: comparison of different water sources for hydroponic units

- Production of African catfish: Feed use and maintenance
 - daily feed intake: 0 – 11 kg

Nutrient water transfer tanks (water exchange between production units)

Aquaculture units

Hydroponic cabines

The Hydroponic unit - automatic control of environmental parameters

- Light intensity
→ Automatic shading
- Temperature
→ Automatic ventilation
- System control
→ Automatic sensors (conductivity, pH, temperature and oxygen)
→ Local network

Hydroponic unit- cabines 1_01-1_05

Cabine:

- **1_01** Polyculture: *Clarias gariepinus & Oreochromis niloticus*
→ Evaluate growth effects on different herbs
- **1_02** Fish Welfare
→ Evaluate effects of aquaponics on fish welfare
- **1_04** Commercial aquaponic plant production
 - Ebb-and-flood-system (cooperation with local retailer “*Grönfingers GmbH*”,
 - → Evaluate effects of different fish stocking densities on plant growth
- **1_05** Cooperation with professorship plant-cultivation,
→ Evaluate different hydroponic sub-systems on plant growth (e.g. NFT, Ebb-and-flood , RAFT)

Hydroponic cabines

Cabin 1_01: Polyculture

Cabin 1_02: Fish welfare

Hydroponic cabines:

Cabin 1_04: Commercial aquaponic plant production

Cabin 1_05: Different hydroponic subsystems

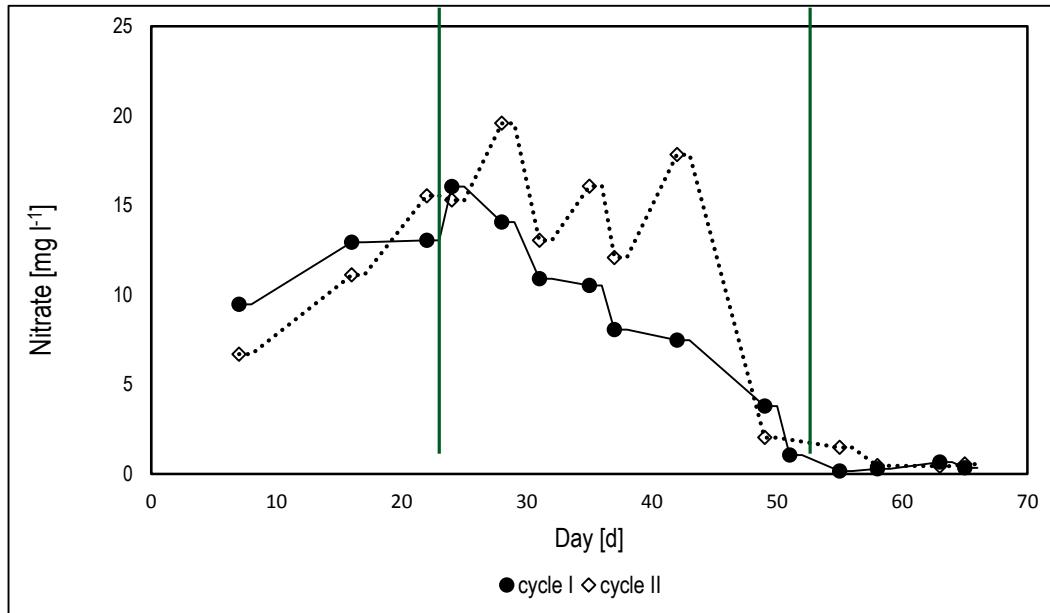

O. niloticus – *C. carpio*

Spring - Summer

Cucumber, Tomato, Salat

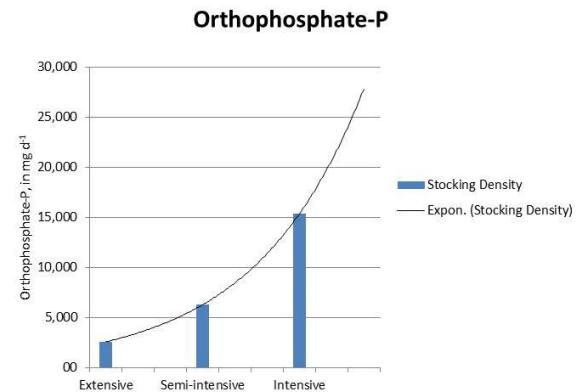

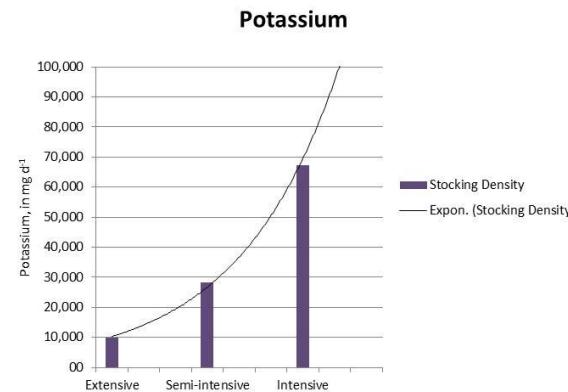

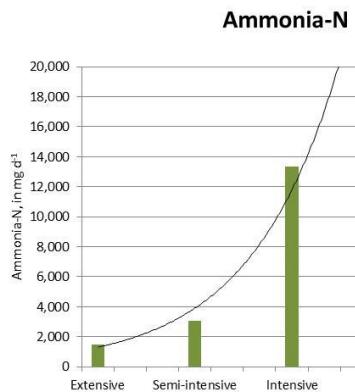

Effects:

- Consumption of nitrate in both cycles
- Cleaning the process water in both species

Knaus, U. & Palm, H.W. (Aquaculture, 2017): Effects of the fish biology on aquaponical cultured vegetables under optimal conditions.

Activity 5.1 => Input for WP3: comparison of different water sources for hydroponic units

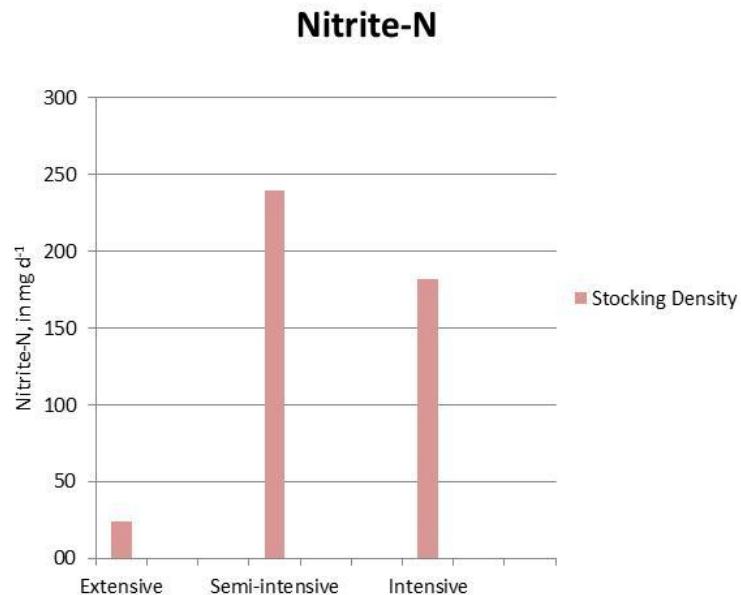

- Results: Stocking density proportionally affects nutrient dynamics (NH_4 , K, $\sim\text{P}$)

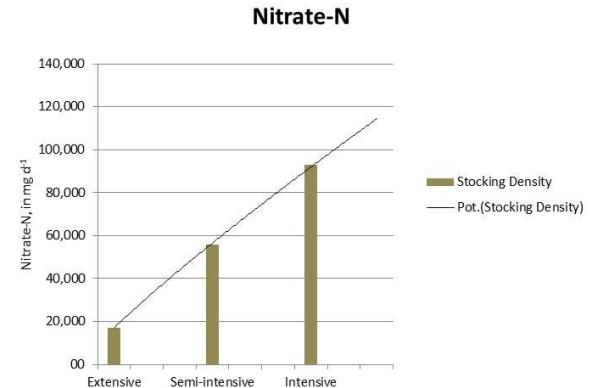

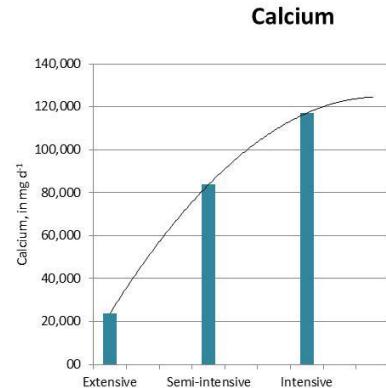

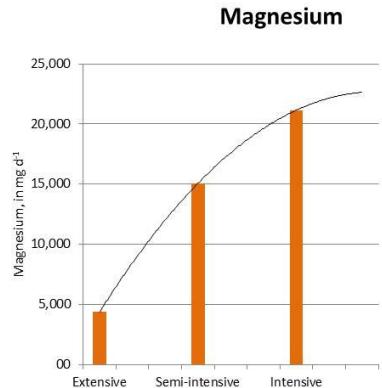

Activity 5.1 => Input for WP3: comparison of different water sources for hydroponic units

- Results: Biofilter size and pH affect nutrient dynamics (NO_2)

Activity 5.1 => Input for WP3: comparison of different water sources for hydroponic units

- Results: Stocking density disproportionately affects nutrient dynamics (Mg, Ca, NO₃)

Activity 5.1 => Input for WP3: comparison of different water sources for hydroponic units

- Planned experiments: Identification of components inside the sedimenters (nutrients, solids or particulate matters)
- Shift of water input source from the sedimenter into the sump
- Mineralisation tank to re-utilize nutrients from particulate matters
- Possibility to incorporate mineralisation tank into commercial production units

Expected outcome (5.1, 5.2, to be used in 5.3 - workshops):

- Different plant performances under combination with catfish => **ongoing**
- Nutrient dynamics and availability for plant production ✓
- Nutrient data to be used by pilot 4 => **delivered and ongoing**
- Effects of nutrient additives (P, K) on fish welfare in aquaponics => **ongoing**
- Effects of polyponics on plant production (basil) => **ongoing**
- Sedimentation and mineralisation in aquaponics => **starting**
- Decision support choosing the right dimension for fish & plant production
- Decision support for the most suitable hydroponic sub-systems
- Effects of feed manipulation on growth and quality of fish & plant
